M1K3's workshop

M1K3-002
HOW IT WORKS
ON-DEVICE AI FOR MAC

What does it take for an AI to live on your machine?

M1K3 is a mechanic, and this is his shop: one bench, one machine. The brain runs with no cable plugged in, memory is filed here, everything that can leave goes through one wall, and a new brain wins question by question or not at all.

0 cables
THE BRAIN NEEDS TO THINK

3 → 1 steps
THE AGENT LOOP WHEN IT RUNS HOT

0.95
SIMILARITY AT WHICH A NEW FACT MERGES

+3 / −8
MOE CHALLENGER VS 12B, PAIRED

01 **Network cable**
Coiled on its hook. The brain needs no connection.

02 **Engine**
The brain, running on this machine's own chip.

03 **Weights cartridge**
Loads only when its digest matches the one in the repo.

04 **Governor and thermometer**
Cool Head reads the heat, caps the loop, keeps the brain.

05 **Face**
The pixel face; its rolling band is the heartbeat.

06 **Still**
Distils a finished chat into FACT lines about you.

07 **Card cabinet**
Memory: a fact within 0.95 of a card merges, else it's filed.

08 **Tool board**
What M1K3 can reach for. One tool is out on the job.

09 **Web slot**
Searches leave here, counted and disclosed each turn.

10 **Private Cloud hatch**
Opens only on your pick, and you're asked once.

11 **MCP socket**
Port 4242 for your own apps, behind a token.

12 **Twin dyno and pegboard**
One question tape, two brains; a peg per question won: 8 to 3.
